supervisor_global_resources

Synopsis

`supervisor_global_resources` = *resourcespec*

This string defines the global resources. It doesn't affect the total number of already reserved resources as they are tracked even after a restart. *Resourcespec* is a comma-separated string of specifications of the form:

`global.`*resource*`=`*quantity*

where *resource* is the name of a resource, and *quantity* is how many resources are available to the system. Typically these resources are licenses, but they could be something else.

Example

`supervisor_global_resources = "global.maya=10, global.shake=5"`

Defaults

(empty)
