

# Firewalls & Ports

It is necessary to have certain ports open for the Qube! Supervisor, Worker, and Client machines to communicate amongst themselves. You should either **disable the firewall** completely on the local machine, or **open specific ports** for Qube! to communicate via TCP and UDP.

## Supervisor ports

- **50001** TCP and UDP inbound
- **50002** TCP and UDP inbound

## PostgreSQL on the Supervisor:

- **50055** TCP inbound

## Worker port

- **50011** TCP and UDP inbound

## Client

- no ports need be open on a machine acting solely as a Qube client

## See Also

For Qube versions earlier than 7.0 that use MySQL, please refer to the documentation that includes the MySQL port information
